1. Introduction

During the past 30 years the study of organized crime has developed into a separate sub-discipline with its own textbooks, journals and professional associations. Although the core subject is crime it has never been a uniquely criminological or even uniquely sociological endeavor.

Given the broad scope of the concept of organized crime which according to varying interpretations encompasses such diverse phenomena as illegal markets, quasi-governmental criminal structures, corporate crime and state crime, the study of organized crime has attracted scholars with academic backgrounds other than criminology and sociology, including anthropology, economics, history, law and political science. Correspondingly, students of organized crime have borrowed concepts and theories from a variety of academic disciplines. However, the multidisciplinary dimension has not necessarily ensured a high level of theoretical penetration of the objects of study. Despite recent advances, the theoretical literature on organized crime remains to be fairly thin and fragmented. In fact, one might even go so far as to say that “organized crime theory”, to the extent it exists at all, is largely an eclectic patchwork and that the various references to other disciplines have added to the confusion that already existed on the conceptual level rather than to clear the fog (Reuter, 1994).

This is not to say that the interdisciplinary dimensions of the study of organized crime are necessarily a liability rather than an asset. On the contrary, it may prove fruitful to piece the conceptual and theoretical fragments together, provided it is done systematically and with careful attention being paid to the empirical evidence.

The ambition behind this paper is not to pick up the loose ends and to integrate them into an overall theoretical framework, but merely to chart the various links to other disciplines outside criminology and sociology as a first step towards a more systematic use of these interdisciplinary influences. For this purpose a wide range of American and international literature on organized crime has been reviewed.

An attempt has also been made to identify current trends in order to determine by what areas of research the study of organized crime might be influenced in the future.

2.1. References to Organized Crime in Other Disciplines

In some cases, the study of organized crime has enriched other areas of research. This is most significant where organized crime has been addressed within a broader or partially overlapping context, with organized crime being regarded as an empirical facet of, or a basic condition for the phenomena under investigation. In these cases, organized crime is not the focal point of interest.

One example is provided by the classic research literature on juvenile delinquency, including Thrasher’s “The Gang” (1927), Whyte’s “Street Corner Society” (1943) and Cloward and Ohlin’s “Delinquency and Opportunity” (1960), which pays considerable attention to organized crime phenomena. Thrasher, for example, treats organized crime, personified by the adult gang, as an outgrowth of the overall gang phenomenon, while Whyte and Cloward and Ohlin view organized crime more in terms of a systemic condition which has some bearing on the social position and patterns of activity of juvenile gangs.

Another, probably far less known example is a treatise on economic organization by German political philosopher Axel Honneth (1994). He discusses Japanese corporations and the Southern Italian Mafia as two manifestations of clannish forms of enterprise in modern societies.

It is more difficult to find an example where the study of organized crime has enriched other areas of research through metaphoric reference or, more elaborately speaking, through analogy. What can be found are references to Mafia or the use of other organized crime related metaphors without drawing upon the scholarly literature on organized crime. Biologist Richard Dawkins, for instance, in his book “The Selfish Gene” is drawing an analogy between genes and “successful Chicago gangsters” (Dawkins, 1989: 2).

1 More extensive references can be found in the management literature; see Anthony Schneider’s “Tony Soprano on Management” (Schneider, 2004) and Deborrah Himsel’s “Leadership Sopranos Style” (Himsel, 2004).
2.2. References to Other Disciplines in the Study of Organized Crime

In general, it seems that the study of organized crime has profited more from other areas of research than the other way round. In these cases, concepts and theories have been adopted either on the assumption that organized crime is a facet of a larger phenomenon under investigation in other disciplines, or on the assumption that sufficient similarities exist between organized crime and the objects of study of other disciplines in order to permit the drawing of analogies.

One type of interdisciplinary link for the benefit of the study of organized crime is established when organized crime is viewed through the lens of, or rather within the paradigms of, another discipline. A good example is the economic analysis of organized crime which rests on the assumption that organized criminal activity is market based and that organized criminal structures are entrepreneurial structures. It is interesting to note that beyond a simple transfer of economics to the analysis of organized crime, the consideration of the specifics of illegality has led to the development of what may be regarded as a separate branch of economic research which is connected with names like Thomas C. Schelling and Peter Reuter.

Finally, findings and insights from other disciplines are introduced to the study of organized crime via analogies. In these cases, perceived similarities between organized crime and other social phenomena serve as a justification to borrow concepts and propositions from at first glance unrelated areas of research. A good example is provided by Letizia Paoli’s treatise on Southern Italian mafia associations in which she uses several metaphors and analogies for purposes of clarification and argumentation. For instance, Paoli draws upon anthropological literature like Sahlins’ “Stone Age Economy” (1972) based on the assumption that there are analogies between mafia associations and primitive societies (Paoli, 2003a: 86). Another case in point is her reference to historical literature on oceanic commerce in the sixteenth century to illustrate her argument that mafia associations cannot be classified as exclusively governmental or business enterprise (Paoli, 2003a: 172).

3. Points of Entry for Interdisciplinary Influences

When one talks about organized crime and how it can be better understood through the use of concepts and theories from other disciplines, it must be emphasized that organized crime as such is not the object of study. Organized crime does not exist as a clearly discernable, coherent empirical phenomenon. Instead, it is first of all a construct. A myriad of aspects of the social universe are lumped together in varying combinations within different frames of reference depending on the respective point of view of each observer (von Lampe, 2003a: 9). Before this background it is problematic to draw on criminological theories to try to explain organized crime without specifying and systematically differentiating the various reference points within the broad picture of organized crime (Kelly, 1987; Kenney & Finckenauer, 1995; Lyman & Potter, 1997).

In describing the object of study, one should speak about a number of different empirical phenomena which are examined in a rather loose conceptual context. These phenomena include certain individuals, the activities these individuals are involved in, the associational patterns through which they are connected, the power structures that subordinate these individuals and collectives to common or particular interests, and the relations between these individuals, structures and activities on the one hand, and the legal spheres of society on the other. These facets of the fuzzy overall picture may also be understood as different levels or
focal points of analysis. When one looks at the body of organized crime literature it becomes apparent that the infusion from other disciplines has not been evenly distributed in the past.

3.1. Individual Level

On the level of the individual “organized criminal” it would be obvious to find some references to psychology. However, given the scant attention the individual offender receives in the study of organized crime, especially in comparison with other areas of criminological research, the influence of psychology has so far only been marginal. This also applies, as Van Duyne (2000) has noted, to organized crime investigations by law enforcement agencies. For the most part, where attention is paid to individual characteristics of organized criminals at all, the emphasis tends to be on the importance of capacities, skills and attitudes (see e.g. Beare, 1996: 52; Van Duyne, 2003: 292; Homer, 1974: 46-62; von Lampe, 1999: 318; Levi, 1998: 424; Moore, 1987: 54).

Psychological concepts and typologies have been used, most notably, by Frank Bovenkerk (2000). Drawing on the “Big Five” dimensions of personality (extraversion, agreeableness, conscientiousness, neuroticism and openness to experience), which are widely recognized in psychology as capturing the most salient aspects of human personality (Huffman, Vernoy and Vernoy, 1995: 479; Morris, 1993: 488), he discusses the personality characteristics required for underworld leadership.

More elusive references to psychological concepts can be found, for example, in Patricia Adler’s description of the “dealing personality” of high-level drug dealers and smugglers (Adler, 1993: 94-97).

3.2. Structural Patterns of Association

The question of how “organized” organized crime is probably lies at the heart of most studies on organized crime since the 1960s. Triggered by Donald Cressey’s claim that organized crime in the U.S. is synonymous with Cosa Nostra and that Cosa Nostra is “both a business organization and a government” (Cressey, 1969: 110), there is an ongoing controversy about the degree to which patterns of criminal cooperation resemble organizational entities in the legal spheres of society and how to best capture the patterns of association that do exist. In the debate references have primarily been made to two major lines of research, organization theory and network analysis.

3.2.1. Organization Theory

3.2.1.1. Description and classification of organizations

Concepts from organization theory have been used both to corroborate and to refute the notion of criminal organizations, or, in a more sober way, to thoroughly analyze empirical structures in their own right. Key concepts from organizational theory (see Hall, 1982) that have variously been used in these respects include size, formalization, centralization, vertical and horizontal differentiation and vertical integration (see e.g. Best & Luckenbill, 1994; von Lampe, 1999; 2003b; Liddick, 1999; Paoli, 2003b; Southerland & Potter, 1993; Varese, 2001; Zaitch, 2002; Zhang & Gaylord, 1996).

For the same purpose of systematically describing criminal structures, Sieber and Bögel (1993) have drawn on the concept of business logistics. They dissected particular areas of crime, like trafficking in stolen motor vehicles and illegal gambling, each with a view to different logistics aspects: procurement-logistics, production-logistics, marketing-logistics,
investment-logistics and comprehensive logistics (e.g., the flow of information or the concealment of activities).

3.2.1.2. Explaining the emergence of organizations
Some analyses go beyond mere description. Dwight C. Smith, for example, has employed the Transaction Cost Economics approach in an effort to explain the emergence of criminal organizations (Smith, 1994; see also Dick, 1995). Smith, in borrowing from Oliver Williamson (1985), argues that in illegal markets just as in legal markets it is a question of relative costs whether a transaction is market-based or occurs within the framework of an organization. He further argues that the factors determining transaction costs in the legal sphere are also decisive in an illegal setting, these being bounded rationality, opportunism and asset specificity. Smith concludes that when the parties of a transaction operate under conditions of uncertainty, when they are prone to self-interest seeking with guile, and when they are making investments that cannot be easily redeployed to other purposes some form of organization is inevitable (Smith, 1994: 135).

3.2.1.3. Explaining the structure of criminal enterprises
Next to the question of the emergence of criminal organizations is the question of how criminal organizations, to the extent they exist at all, are shaped and structured. Once again it is Dwight C. Smith who has made a significant contribution by transferring the open-system perspective in organization theory to the analysis of illicit enterprises. Drawing on James Thompson (1967) he has argued in his “spectrum-based theory of enterprise” that the structure of an illicit enterprise is largely determined by the core technology it uses to produce goods or services and by the task environment which comprises external conditions that enable it to function and, at the same time, offer hazards to its continuance (Smith, 1975; 1978; 1980). Later, Smith re-emphasized this point with a reference to Multiple- Constituencies Theory according to which organizations are not the initiators but the result of action, being continuously shaped and reshaped in exchanges between various stakeholders (Smith, 1994: 132-133; see also Halstead, 1998).

Potter and Southerland (1993), in a similar vain have applied key concepts of organization theory to grasp possible variations in the structure of illegal enterprises and to develop propositions about how this structure is affected by a variety of factors. They have particularly refined the analysis of environmental conditions, using concepts including market diversity, complexity, stability, and hostility (see also Potter, 1994).

3.2.2. Network Analysis

3.2.2.1. Description of how organized criminals are associated
References to organization theory have become less prominent in recent years as organized crime is increasingly viewed in terms of criminal networks. The underlying notion is that “(o)rganized crime is, at its most basic level, a product of overlapping and interrelated social relationships” (Potter, 1994: 116; see also McIllumain, 1999: 304). When the network concept was first introduced to the study of organized crime it was adopted from anthropology as a descriptive tool to explore the essential features of interpersonal relations. This was done either because of the intention not only to examine criminal organizations in the true sense of the word, as in Ianni’s study of black and Hispanic crime groups in the New York Area (Ianni, Fisher & Lewis, 1973; Ianni, 1974), or it was done with a view to rejecting the notion of criminal organization, as is the case with Hess’ study of the Sicilian Mafia (Hess, 1998). The network concept continues to be widely used for descriptive purposes (see e.g. Bruinsma & Bernasco, 2004). However, since its modest beginnings in the 1950s and 1960s, network analysis has developed into a more sophisticated, computer based
methodology suitable for the handling of large data sets (Scott, 2000). As such it has been used, for example, in the study of Russian immigrant crime in the U.S. by Finckenauer and Waring (1998) who have analyzed different types of law enforcement and open source data to establish webs of interpersonal relations between criminals.

3.2.2.2. Explaining organized criminal activities and structures
The network concept has not only been used for description, but also in a more analytical sense. Peter Lupsha (1983), for example, in a network analysis of a criminal group, has challenged some widely shared views on organized crime, while Carlo Morselli has attempted to develop hypotheses drawing on recent contributions to network theory, including Burt’s Structural Hole Theory (Burt, 1992). Morselli analyzed the biographies of two prominent criminals, Welsh dope dealer Howard Marks and American Mafia figure Sammy “The Bull” Gravano, to explore which features of personal networks may account for a successful career as crime entrepreneur. Morselli argues that not so much the size but the overall structure of the criminal network and the position occupied within it determine the extent of success of a given criminal (Morselli, 2005).

3.3. Overarching Power Structures
Following the distinction of different levels of analysis set out earlier, there are criminal structures that overarch individuals and collectivities. For these structures Alan Block has coined the term “power syndicates” as opposed to “enterprise syndicates” (Block, 1983: 13). The phenomenon of extortion gangs that prey on illegal enterprises has been discussed by a number of economists, most prominently by Thomas C. Schelling (1967; 1971) and by Peter Reuter (1983). Schelling and Reuter essentially explain the emergence of power syndicates with the need for non-violent conflict resolution. While Schelling points to the general advantage of internalizing the costs of violence, underscoring his argument with an analogy to the whaling industry (Schelling, 1967: 118), Reuter argues that the demand for arbitration may vary between market levels and between different types of illegal markets (Reuter, 1983). Another noteworthy contribution to the discussion has been made by Skaperdas and Syropoulos (1995) who have used a game theory model resting on an analogy between power syndicates and primitive states to explain the emergence of criminal groups specializing in the monopolistic use of violence.

Another approach is taken in a paper by Chang, Lu & Chen (2005) who propose a three-stage game model to explain individual choices to join a power syndicate. Their underlying concern is optimal law enforcement. An earlier paper by Nuno Garoupa (2000) falls into the same mold.

3.4. Activities
Looking at structures of association as the focal concern is only one option in the study of organized crime. Alternatively one can look primarily at structures of activity (Cohen, 1977: 98). This perspective has paved the way for yet other concepts and theories from economics to be introduced to the study of organized crime.
3.4.1. Crime as Market

Perhaps the most long lasting and most broadly based discussion within the parameters of the economic analysis of organized crime is about the monopolization of illegal markets (Buchanan, 1973; Hellman, 1980; Luksetich & White, 1982; Reuter, 1983; 1985; Rubin, 1973; Schelling, 1967). Two issues are at the center of the debate. One issue concerns the degree to which a tendency towards monopolization is inherent in illegal markets. The other issue refers to the social costs and benefits of illegal market monopolies. Empirical research, of course, suggests that this debate is largely theoretical because monopolies seem to be the exception rather than the rule in illegal markets (see e.g. Gruppo Abele, 2003; Johansen, 2005; Paoli, 2003b; Reuter, 1983; Reuter & Haaga, 1989).

3.4.2. Crime as Business Sector

Phil Williams has widened the scope of analysis from the narrow issue of market concentration to the more general issue of industry structure. Drawing on Michael Porter’s industry analysis model (Porter, 1980) he analyzed heroin and cocaine trafficking with a view to five major factors believed to determine the profitability of an industry: the extent of the rivalry among existing firms, the number and kind of potential entrants, the bargaining power of the buyers or consumers, the bargaining power of suppliers, and the threat of substitute products or services (Williams, 1995).

A different perspective has been adopted by Vincenzo Ruggiero in his analysis of the illegal labor market. Ruggiero argues that major trends in the illegal economy, like the emergence of a “criminal reserve army”, have precedents in the historical development of the legal economy (Ruggiero, 2000).

On a more metaphoric level H. Richard Friman (2004) has looked at the consequences of law enforcement intervention on drug markets with a view to vacancy-chain effects, a concept originally developed to explain upward mobility in organizations and sectoral labor markets.

3.5. Legal/Illegal Nexus

The individuals, structures and events associated with organized crime do not exist in a social vacuum. Rather they are tied in with their surroundings in some ways or other. One aspect is the “social embeddedness” of organized crime in certain social strata, milieus or ethnic communities (see Kleemans & Van de Bunt, 1999). Anomie theory has been one obvious choice to explain this connection with regard to migrant communities (Bovenkerk, 1998; O’Kane, 1992), whereas concepts and theories from social and cultural anthropology have been applied to indigenous organized crime phenomena like the Sicilian Mafia (Cottino, 1999; Hessinger, 2002).

Many discussions of the links between illegal and legal spheres of society tend to have some overlap with political science issues. Accordingly, some more or less intense references to political science concepts and theories can be found, such as those relating to policy, legitimacy, governance and governability. This is true, for instance, regarding research on criminal policy (Bullington, 1993), regulatory policy (Clapp, 1999; Koser, 2000), corruption and criminal-political alliances (Bellis, 1985; Block & Griffin, 1997; Chambliss, 1978; Gardiner, 1970; Karklins, 2002; Nelken & Levi, 1996; Schulte-Bockholt, 2001), criminal activity of insurgency movements (Naylor, 2002), state support for criminal groups in the context of foreign policy (McCoy, 2002), globalization and state power (Helleiner, 1999; Mittelman & Johnston, 1999), and on societies in transition (Volkov, 2000).
The latter issue is also addressed by Michael Keren (2000), but from an economic perspective, using a model of career choice to explain the weakening of state power by the underworld in Eastern European countries.

3.6. Meta-Level

Assuming that the five identified levels of analysis (individuals, patterns of association, overarching power structures, activities, and legal/illegal nexus) essentially cover the main aspects commonly subsumed to organized crime, there is an additional, rather important line of research within the study of organized crime which deals not with the reality of organized crime but with its social construction. This issue has been addressed from different vantage points and with different focal interests.

Some studies take an interest in the debate on organized crime merely to explore broader contexts, such as the history of the United States in the Cold War era (Bernstein, 2002), the “sociology of sociology” (Reynolds, 1995) or international politics (Edwards & Gill, 2002), while other studies are motivated by a primary interest in the empirical side of organized crime (Albanese, 1988; 1991; Albini & Bajon, 1978; Bell, 1963; Van Duyne, 2004; von Lampe, 1999; 2001; Smith, 1975; 1991; Woodiwick, 2001). These latter studies provide examples for the influence of other disciplines to the extent they have borrowed concepts and methodologies, such as the anthropological concept of belief systems (Albini & Bajon, 1978), the methodological tools of discourse analysis (Edwards & Gill, 2002), or the conceptual history approach (von Lampe, 1999; 2001; see also Smith 1975) which was borrowed from historical research (Koselleck, 1972).

3.7. Methodology

The application of methodologies that have been developed in other disciplines is a widespread phenomenon beyond the analysis of the social construction of organized crime. One example is provided by methods originally developed to support strategic and tactical management decisions. These methods include environmental scanning (see e.g. Black et al., 2001; Vander Beken & Defruytier, 2004) and the scenario approach (Wagner, Boberg & Beckmann, 2005).

Another example is the borrowing of population estimation methods from zoology for estimating the size of illegal markets (Bouchard & Tremblay, forthcoming).

4. Critique

Borrowing from other disciplines can be useful in different ways. Transferring concepts can help in describing and categorizing organized crime phenomena, and transferring theoretical notions can contribute to the formulation of testable propositions. But there is also the danger of forcing inadequate conceptual frameworks onto the analysis of organized crime. The uncritical transfer of concepts and theories may unduly narrow or shift the focus of attention, or may lead to an over-interpretation or misinterpretation of findings. The use of concepts from organization theory, for example, may mislead observers into assuming the existence of organizational units where in fact they do not exist (Sieber & Bögel, 1993). Reversely, the fact that patterns of association lend themselves to network analysis should not automatically lead to the conclusion that organizations in the true sense of the word do not exist (Finckenuer & Waring, 1998).
To avoid these mistakes it appears necessary to transfer concepts and theories from other disciplines with great caution. Ideally, borrowing from other disciplines should occur only after careful naturalistic observation and a tentative ordering of the objects of study.

5. Outlook

5.1. Impulses for Interdisciplinary Influences in the Future

There is no reason to believe that in the future insights from other disciplines will become less important for the study of organized crime. Two factors in particular will continue to have an impact. On the one hand, trends and fashions in science have a tendency to spread across the boundaries of a particular discipline so that whatever scientific concepts and theories become fashionable in the future can be expected to have some bearing on the study of organized crime.

On the other hand, trends within the study of organized crime are bound to fan new desires to borrow from other disciplines as the focus of attention shifts from well researched aspects to hitherto neglected or newly emerging phenomena.

5.2. Current Trends

The question, then, is not whether or not the study of organized crime will be influenced by other disciplines in the future but in what way this influence will occur. Looking at current trends some cautious predictions can be made.

5.2.1. From Organization, to Network, to Individual Criminals

There is one trend in particular that gradually seems to become prevalent in organized crime research today. This trend involves the shift from a focus on criminal collectivities, initially on organizations and later primarily on criminal networks, to the individual “organized criminal”. This trend, to the extent it is real, marks a departure from the notion of relatively static structures to the notion that in a chaotic and ever changing criminal world the least common denominator is the individual offender who may or may not link up with other offenders.

Until now the individual “organized criminal” is probably the most under researched component of the overall picture of organized crime, not least because individual explanations of crime in criminology tend to focus on psychopathic and sociopathic offenders, thereby ignoring many kinds of offenders that have been observed in connection with organized crime. It can be expected that this will change in the future, if only in a desire to be original, and that along with a stronger emphasis in empirical research on personal characteristics and capacities of “organized criminals” more attention will be paid to possible contributions from other disciplines, especially psychology.

At the same time, with advances in genetics and neurobiology there is a renaissance of approaches in criminology that center on the individual offender while sociological perspectives are on the defensive (Siegel, 2003). This trend may eventually have an impact on the study of organized crime as well.
5.2.2. Explaining Co-Offending

The second, related trend is to no longer take the existence of criminal organizations and criminal networks for granted but to explore the conditions under which patterns of criminal association and co-offending emerge (see e.g. Weerman, 2003). An important concept in this respect which currently enjoys broad attention in the social sciences, including economics, and which is frequently though not consistently referred to in the organized crime literature is the concept of trust (von Lampe & Johansen, 2004). It is likely that this issue will receive more attention in the future and that in this context additional influences from social psychology and other disciplines will take an effect on the study of organized crime.

The issue of trust can also serve as an example of how findings from the natural sciences, specifically neurobiology, may have direct relevance for organized crime. Recent research shows that a hormone, the neuropeptide oxytocin, affects an individual’s willingness to accept social risks arising through interpersonal interactions without generally increasing the readiness to bear risks (Kosfeld et al., 2005). This, however, does not automatically lead to deterministic explanations of trusting behavior as neurochemistry, including the oxytocin system, are strongly affected by social factors (Pedersen, 2004; see also Aragona & Wang, 2004).

Other fields of research that concepts and theories may be borrowed from for the purpose of analyzing co-offending and criminal association include sociobiology with a view to cooperation under adverse conditions (Wuketits, 1997), and gender studies with a view to the aspect of male bonding. There already is some literature on the role of women in organized crime that challenges the view that it is an exclusively male affair (Allum et al., 2003; Calder, 1995; Denton & O’Malley, 1999; Graziosi, 2001; Kleemans & Van de Bunt, 1999; O’Kane, 1992; see also Miller, 2001). But considering that organized crime nonetheless appears to be primarily about male association, there is a good chance that in the future the literature on male bonding patterns (see e.g. Tiger, 1984) will receive increasing attention among organized crime researchers.

Finally, the concept of social capital should be mentioned in this context as one which could gain importance in the study of organized crime (Morselli, 2005). Social capital refers to social networks and the norms of reciprocity and trustworthiness that arise from them that affect the productivity of individuals and groups (Putnam, 2001: 19). The concept may be particularly interesting before the background of efforts to measure social capital (see e.g. Stone, 2001). This could pave the way for a measurement of the capacities of individuals and collectivities to successfully commit crimes on a continuous basis.

6. Conclusion

When one looks at organized crime research in general and its interdisciplinary dimensions in particular, a contradictory picture emerges. There are on the one hand a multitude of references to other disciplines that would suggest that the study of organized crime is keeping pace with scientific progress. At the same time, these infusions are uncoordinated and the eclecticism adds to the already existing confusion over what is to be analyzed. In other words, borrowing from other disciplines cannot alleviate the fundamental problem confronting the study of organized crime, the lack of a shared understanding of its object of study.

What is needed is a research program that would allow building up a cumulative body of knowledge (von Lampe, 2002). Within such a framework it would be a natural development to see the study of organized crime increasingly becoming intertwined with other areas of research, given that organized crime is not a separate empirical phenomenon but a construct that encompasses a multitude of facets of social reality that fall in the domain of different
disciplines including psychology, sociology, economics, and political science. In this light one could describe the study of organized crime as an endeavor to systematically explore social phenomena under conditions of illegality. The end-result could be something of an extension of Smith’s spectrum-based theory of enterprise towards a spectrum-based theory of society. The more this view takes root and the deconstruction of the concept of organized crime progresses, the more the study of organized crime should become a truly multidisciplinary endeavor.
